

• THERMONITOR

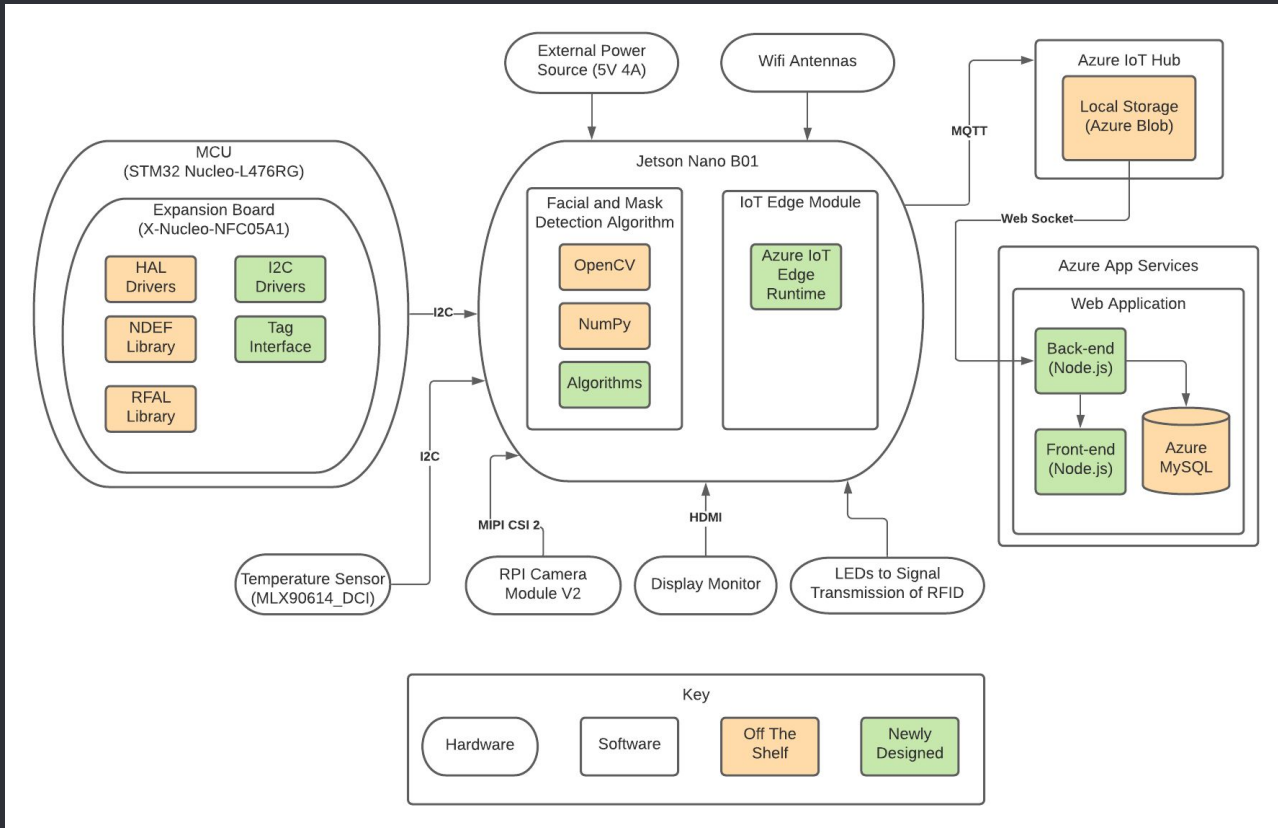

Minji Kim, Iris Wang, Jiamin Wang
Team A6

- # Application Area

A safe and affordable way to provide temperature monitoring solution to large organizations with existing identification cards.

Block Diagram

• Solution Approach

STM32 MCU: Processor for RFID

- Ultra low power
- I2C RFID transmission to Jetson Nano

Jetson Nano: Core Processor

- LEDs signal successful transmission
- YOLOv3 object detection algorithm

Microsoft Azure: IoT Web App

- IoT Hub for cloud gateway & message routing
- Azure Web Services for deployment & hosted database

• Complete Solution

Standalone product with single power cord that allows users to be identified through a RFID card. Identified users will then measure their temperature, which can be monitored in real time on a web application.

The screenshot shows the Thermonitor web application interface. At the top, there is a green shield logo and the text "Thermonitor". Below this is a dropdown menu labeled "Select a device" with the value "jetson-nano-moon0" selected. Underneath is a section titled "Records" containing a table with three columns: "ID", "Temperature (°C)", and "Timestamp".

ID	Temperature (°C)	Timestamp
230E80A3	34.57	12/1/2020 3:11:45 PM

• Design Tradeoffs

- **Getting rid of the wake-up signal**
 - Power efficiency vs. User experience and interface
- **Use of YOLOv3 instead of Haar Cascade**
 - Time efficiency vs. Complexity of detection
 - YOLOv3 is faster since analyzes entire image at test time
- **Lower output video stream resolution**
 - Performance (FPS) vs. video quality on display
 - Settled on 800x600 with 7 FPS

• Metrics and Validation

Components	Expected Metrics		Actual Metrics	
RFID Scanner	99% accuracy		100% accuracy	
Facial/Mask Detection	85% face detection 5% false positive 1-2% false negative	95% mask detection 3% false positive 1-2% false negative	90% face detection <5% false positive <5% false negative	95% mask detection 40% false positive <5% false negative
	Output Video Stream: 10 FPS		Output Video Stream: 7 FPS	
Temperature Sensing	±0.2 degrees of error		±0.2 degrees of error	
IoT External Platform & Integration	100% message transfer rate User testing and feedback		100% message transfer rate Ease of use: 9/10 Overall Design: 10/10	

- Face and Mask Detection

Mask On (95%)

Improper Mask (60%)

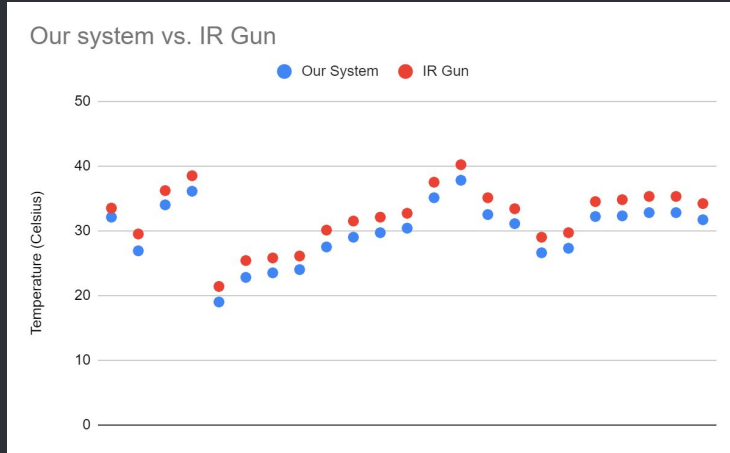

Mask Off (99%)

Multiple People in Frame

• Temperature Sensing

- Average difference between readings: **2.4 °C**
- Calibrated our final reading by adding this offset

Failed Temperature > 38.0 °C

*was not actually sick 🤒

• RFID and IoT

Unique ID associated with any type 4 or type 5 RFID/NFC tag is eventually sent to our web application, hosted on Microsoft Azure.

Please rate how easy it was to use the web application.

10 responses

Please rate the overall design of the web application.

10 responses

Conducted user testing with a survey on two metrics -- usability and overall design.

Project Management

Legend:		Minji	Iris	Jiamin	Team							
		Iris and Minji				November				December		
Milestone Descriptions		Member				11/2 - 11/8	11/9 - 11/15	11/16 - 11/22	11/23-11/29	11/30 - 12/6	12/7 - 12/13	12/14 - 12/21
Final Project												
	Integration of all the components	Team				[Green Bar]						
	Enclosure Design	Jiamin					[Yellow Bar]					
	LEDs to signal transmission success	Jiamin						[Yellow Bar]				
	Push for facial/mask detection accuracy	Iris and Minji								[Purple Bar]		
	Finalize App/Website	Iris and Minji								[Purple Bar]		
	Database of RFID and ability to add/remove users	Iris and Minji								[Purple Bar]		
	Final Project Presentation	Team								[Green Bar]		
	Blog Post + Final Video	Team									[Green Bar]	
	Final Project Report	Team										[Green Bar]
	Message Transmission (Encryption and Decryption)	Minji						[Blue Bar]				
	Design document	Team						[Green Bar]				
	Temperature Sensor and I2C	Iris and Minji								[Purple Bar]		
	Facial/Mask detection accuracy	Iris and Minji								[Purple Bar]		

• Lessons Learned

- Integration is difficult and time-consuming due to unexpected roadblocks
- Documentation is crucial
- Difficult to optimize existing libraries for specific hardware
- Set high goals
- Final product is really rewarding to see
