Team A2: SuperFret

Owen Ball, Ashwin Godura, Tushaar Jain

Use Case

When trying to learn guitar, beginners face challenges trying to learn how to finger notes and maintain rhythm

The SuperFret system shall:

1. ***Visually indicate notes***
2. ***Detect finger positions***
3. ***Facilitate learning scales***
4. ***Provide feedback***
5. ***Be intuitive to use***

Design Requirements

Hardware

- ≥ 56 individually addressable LEDs (14 frets, 4 strings).
 - ***“Visually indicate notes”***
- Can light up $\frac{2}{3}$ of LEDs at half brightness
 - ***“Facilitate learning scales”***
- Audibly ($\sim 60\text{dB}$) indicate target tempo
 - ***“Be intuitive to use”***
- $< 1 \text{ mA}$ through body max (based on IEC 60479-1)

Firmware

- $< 50\text{ms}$ latency from strum to LED response
 - ***“Visually indicate notes & Provide feedback”***
- Support 100 beats per minute and down to $1/8\text{th}$ notes

Design Requirements

Web Application:

- Start and stop routines on the guitar
- Add up to 1GB of user's own MIDI files
- Display practice statistics (rhythm score, accuracy score)
 - ***"Provide feedback"***
- < 0.25 second network delay

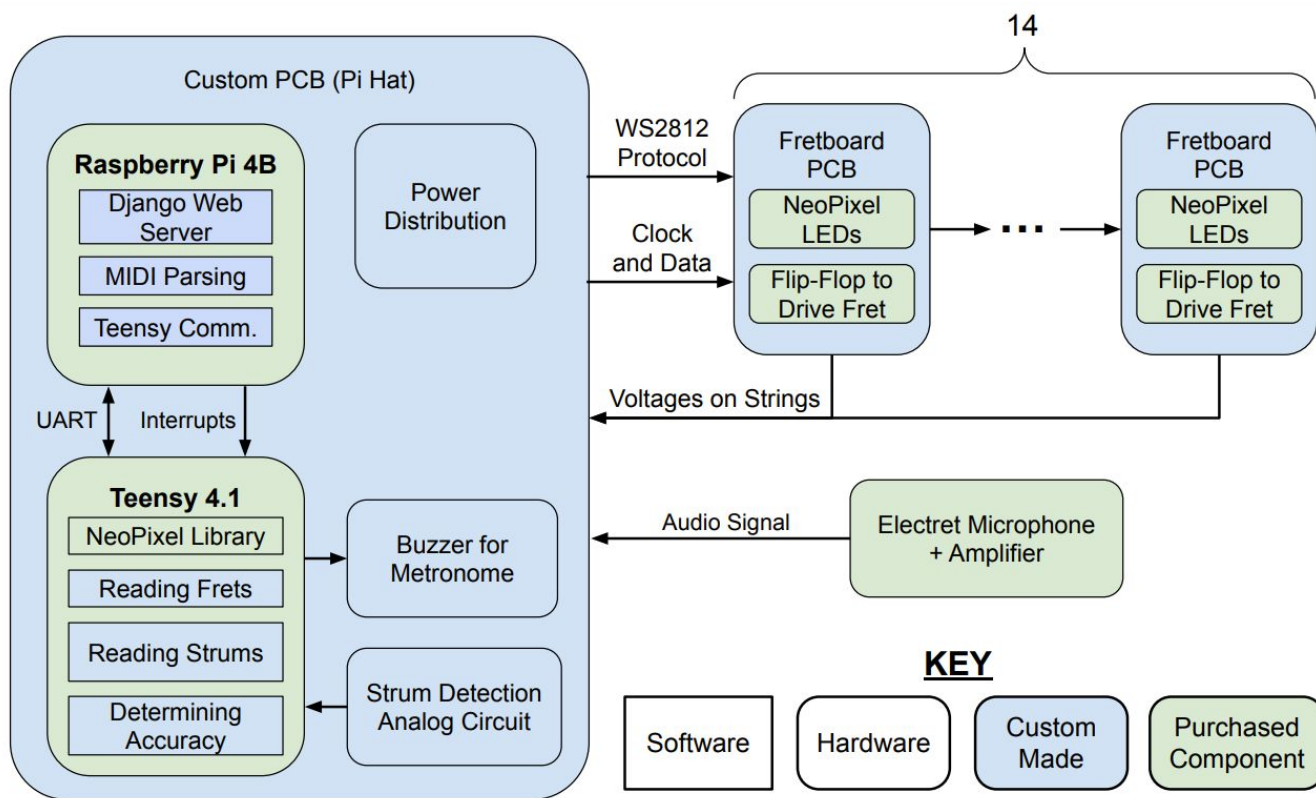

System Accuracy

- 99% accuracy for detecting finger placement and strumming
 - ***"Detect finger positions"***
- 100% accuracy for lighting up the correct LED(s) for a note or scale

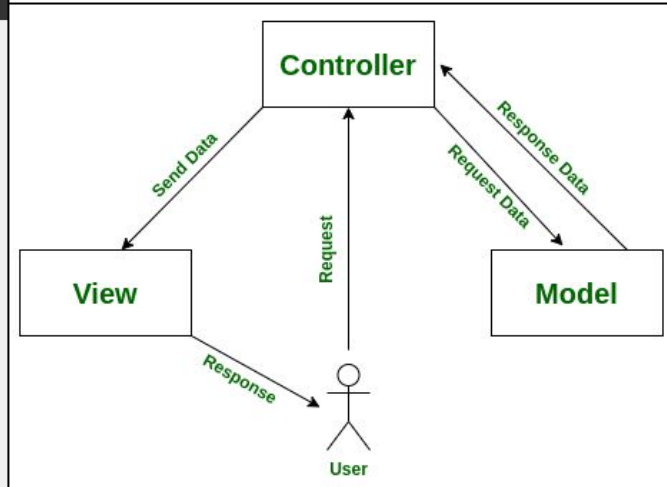

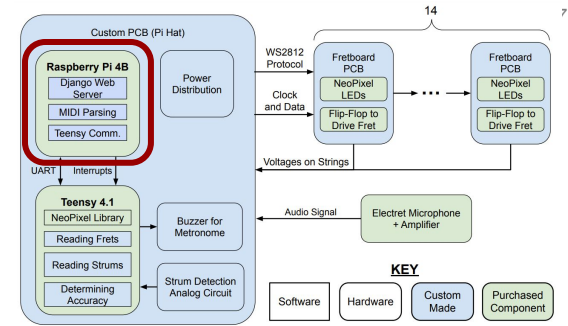

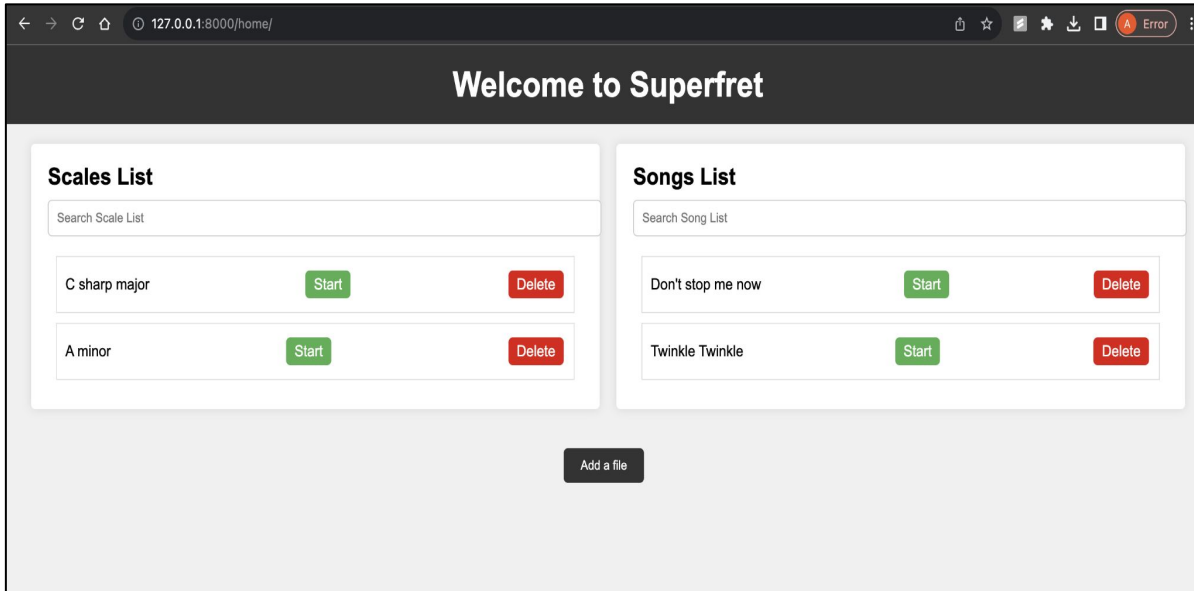

Solution Approach

Overall Block Diagram

Implementation - Web Application

Implementation - Microcontroller

```

40 54 68 64 (MThd)
00 00 00 06
00 01 (format 1 = one or more simultaneous tracks)
00 03 (3 tracks)
01 80 (0x180 = 384 ticks/quarter note)

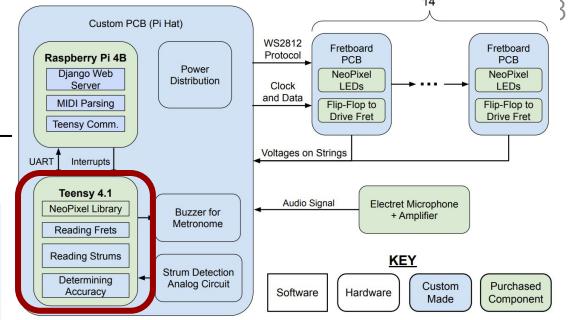

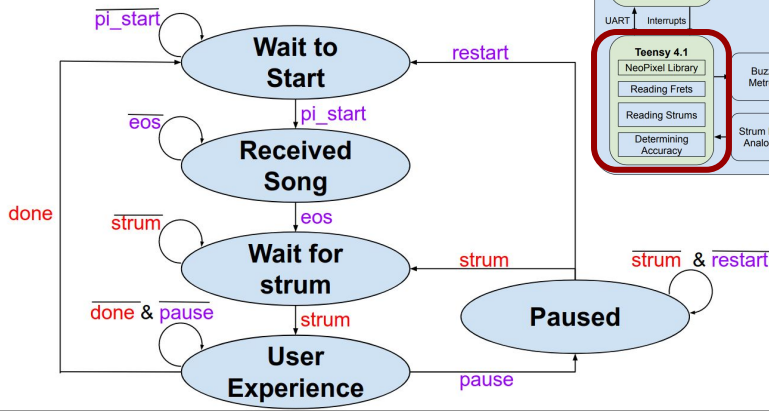

40 54 72 68 (MTrk)
00 00 01 D2 (Chunk length 0x01D2 = 466 bytes follow)
00

Piano (Classic)) - sky blue
00
C0 00 (Program Change on ch 0)
00 (0 delta MIDI ticks)
90 3C 32 (0x90 = Note ON event, 0x3C = Note 60 (C4), 0x32 = 50 velocity)
81 40 (Variable length encoding 1000|0001 0100|0000 = 00000011000000 = 192 ticks)
80 3C 00 (0x80 = Note OFF event, 0x3C = Note 60 (C4))
    
```

```

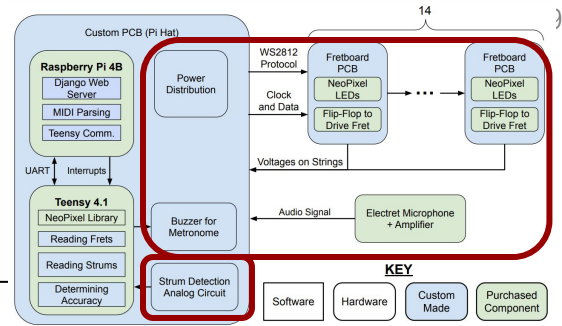

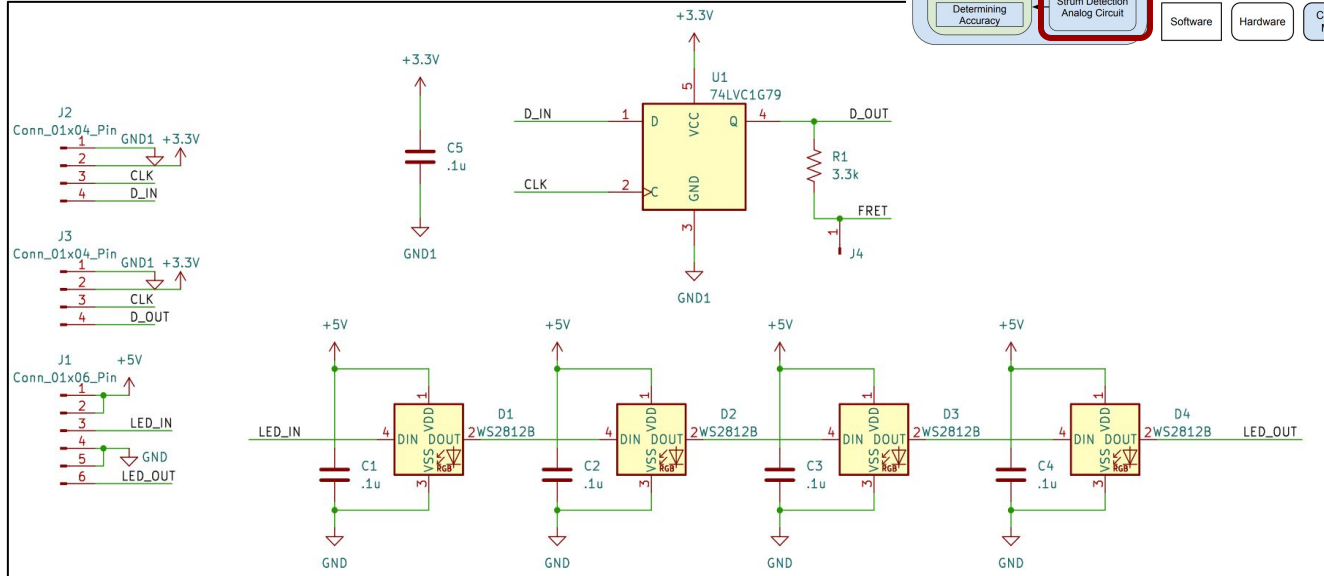

void parseMIDI() {
    int NUM_BYTES = sizeof(MIDI);

    bool parsed_MThd = false;
    uint32_t bytes_in_MThd_header = 0;
    bool parsed_bytes_in_MThd_header = false;
    bool parsed_bytes_in_MTrk_header = false;
    bool parsed_ticks_per_quarter_note = false;
    bool parsed_MTrk = false;
    uint32_t bytes_in_MTrk_header = 0;

    NUM_NOTES_FOUND = 0;
    MICROSECONDS_PER_BEAT = 500'000; // default
    TICKS_PER_QUARTER_NOTE = 48; // default
}
    
```

Implementation - Hardware

Testing, Verification, and Validation

<p>Latency</p>	<p><u>Hardware</u>: Oscilloscope to measure delay between stimuli, such time from strumming to LEDs being written to <u>Webapp</u>: Measure one-way latency using time stamped requests</p>
<p>Accuracy</p>	<p><u>Strums</u>: Play 100 1/8th notes at 100 BPM on each string and record the ambient sound level. <u>Finger Placement</u>: Place a finger on each combination of string and fret position and monitor serial port. <u>LEDs</u>: Light up each LED white and verify that the proper LED lights up. Verify current when illuminating all LEDs white at 50% brightness is <1.5A</p>
<p>User Experience</p>	<p>Have users evaluate categories on scales from 1 to 5 to create a quantitative metric <u>Webapp</u>: Intuitive interface, easy to read statistics, intuitive uploading of songs, etc <u>Hardware</u>: Comfortability, effectiveness of LEDs, volume and pitch of metronome</p>

Risks Mitigated

- Lack of web app experience. Switching from Flask to Django
- Understanding MIDI files

New Challenges

- Detecting open strings
 - There is no fret-string contact
- Multiple ways to play the same note
 - How to choose where to instruct the user to play?

Project Management
