

Carnegie Mellon University

Team A2: SuperFret

Owen Ball, Ashwin Godura, Tushaar Jain

Use Case Requirements

Functional Requirements

- 'Training' and 'Performance' modes
- ≥ 14 frets (~2.5 octaves)
- Support 1GB of user's MIDI files
- Audible Metronome for tempo

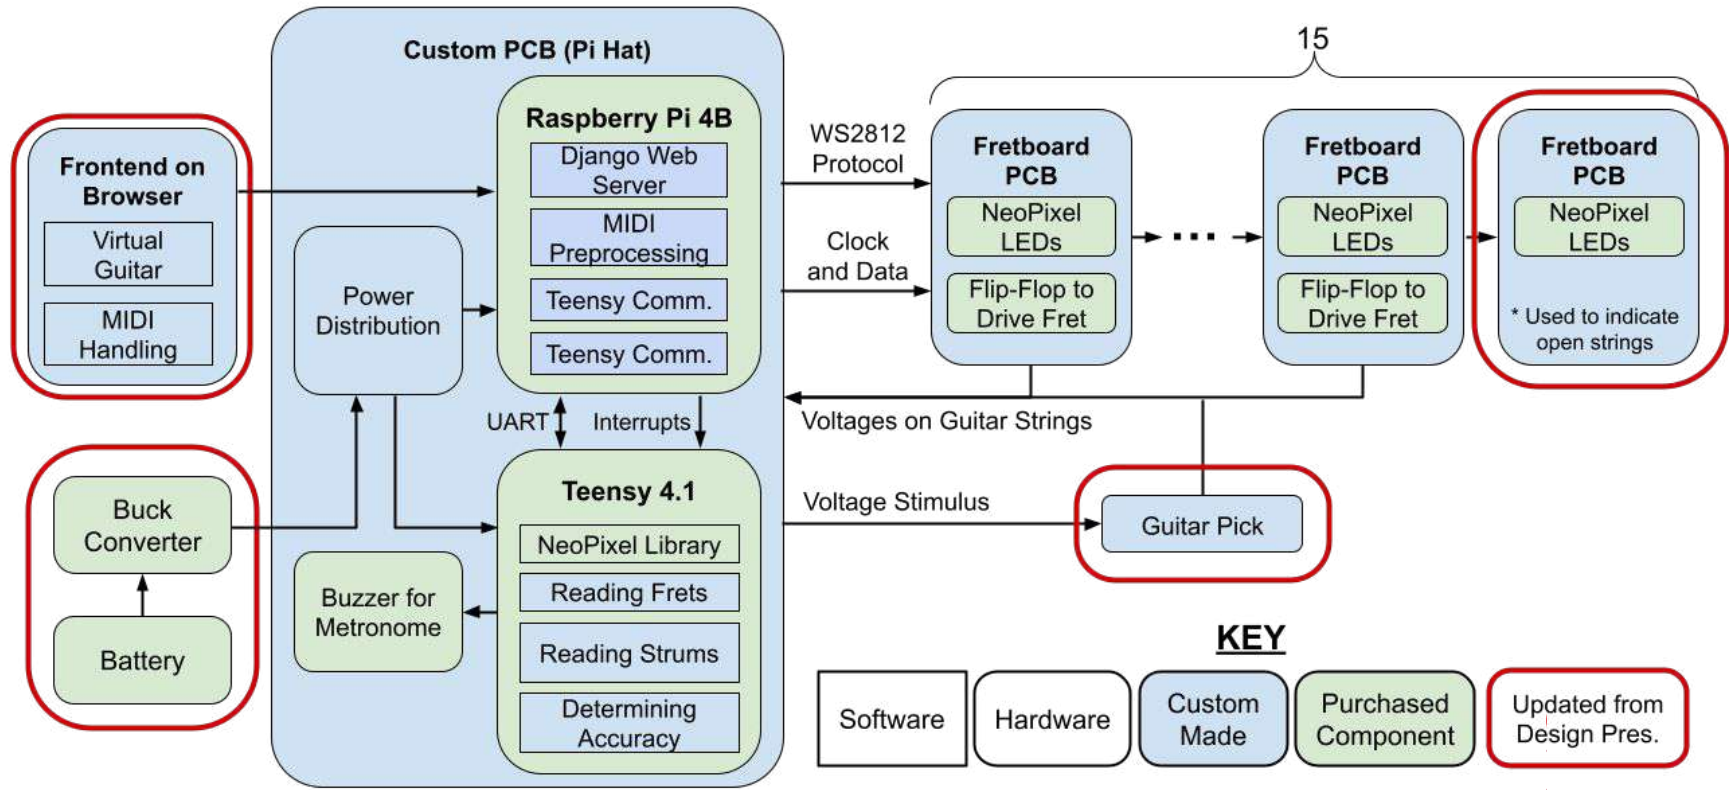

User Experience

- Intuitive web app (<5 minutes to get acclimated)
- Electronics don't interfere
- LEDs are visible and effective
- System is responsive

Solution Approach

Overall Block Diagram

Public Demonstration Solution

Public Demonstration Solution

- Customize song options
- Fill in the gaps
- Listen to the actual file
- View playing statistics

Speed: 1

Transpose: 0

Metronome Volume: 5

Select a track: Mode: Training Performance [re-submit](#)

Fret Numbers -> 1 2 3 4 5 6 7 8 9 10

[Back to Home](#) [Pause](#) [Simulate Strum](#) [Toggle Listening](#)

Testing, Verification, and Validation

<p>Latency</p>	<p><u>Hardware:</u> Use oscilloscope to measure delay between stimuli, such as time from strumming to LEDs being updated <u>Webapp:</u> Measure one-way latency using high frame-rate video</p>
<p>Accuracy</p>	<p><u>Strums:</u> Play 200 notes at various BPMs on each string and record % correct <u>Finger Placement:</u> Place a finger on each combination of string and fret position, verify correct LED underneath is illuminated <u>LEDs:</u> Load various MIDI files on guitar and verify that the proper notes are illuminated</p>
<p>User Experience</p>	<p>Have users evaluate categories on scales from 1 to 10 to create a quantitative metric <u>Webapp:</u> Intuitive interface, easy to read statistics, intuitive uploading of songs, etc <u>Hardware:</u> Comfort, effectiveness of LEDs, volume and pitch of metronome</p>

Design Requirements

Metric	Target	Actual
MIDI to fretboard LED conversion accuracy	100%	100%
Finger placement detection accuracy	≥99%	100%
Strums per minute supported	≥200	300
Strum detection accuracy	≥99%	99%
Latency from strum to LEDs updating in response	≤50ms	1.85ms
Latency from strum to web app updating in response	≤250ms	215ms
Average current through body possible	≤1mA	5.37μA
Total system current with all LEDs at ½ brightness	<4.5A	0.96A

Use Case Testing

Website:

- How intuitive is the interface? - 8.5
- How responsive is the website? - 10
- How aesthetic is the website? - 7

Guitar:

- How intrusive are our modifications? - 10
- How visible are the LEDs? - 10
- How Responsive is the guitar? - 9

How cohesive is the entire experience? - 10

Meaningful Comments:

- Some note placement timing can be tricky
- Power adapter is bulky

Engineering Tradeoffs

MIDI Parsing

	Parsing on RPi and Teensy	Only parsing on the RPi
Benefits	<ul style="list-style-type: none">- Teensy gets <i>musical</i> information- Decouple Teensy & RPi development	<ul style="list-style-type: none">- Simpler Teensy software- Easier to maintain
Drawbacks	<ul style="list-style-type: none">- Complex Teensy software- Code duplication	<ul style="list-style-type: none">- Teensy doesn't get <i>musical</i> information- Couples Teensy & RPi development

Engineering Tradeoffs

Audio/Piezoelectric vs Pick-Based Strum Detection

	Audio/Piezoelectric	Electrode on Pick
Benefits	<ul style="list-style-type: none"> - Non-intrusive - Can play without pick 	<ul style="list-style-type: none"> - Extremely fast response time (~1.5ms) - Immune to external noise and vibrations - Allows detection of which string strummed
Drawbacks	<ul style="list-style-type: none"> - Sensitive to external noise - Slow response time (~50ms) - Complex to calibrate - Relatively inaccurate (~90%) 	<ul style="list-style-type: none"> - Requires playing with a custom guitar pick - More intrusive to user

Tested solution for audio-based detection

Pick with metal electrode
