POKERCAM

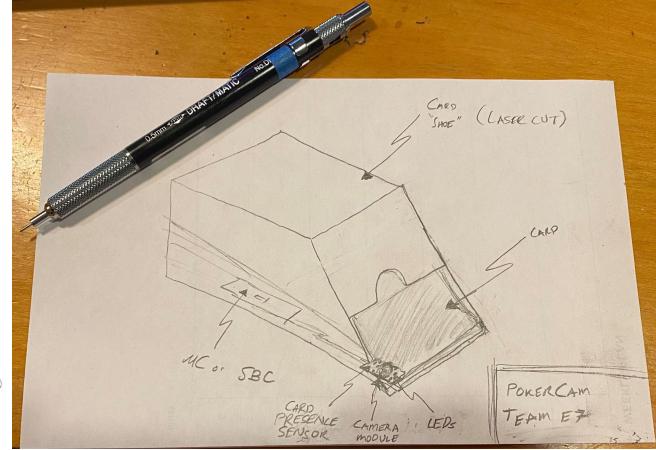

Spring 2021 - Team E7 Jeremy Klotz, Ethan Rich, and Sid Domala

Background and Use Case

- Most professional card games analyses are not automated
- Our system:
 - Images cards as they are dealt
 - Provides a web interface to visualize hands

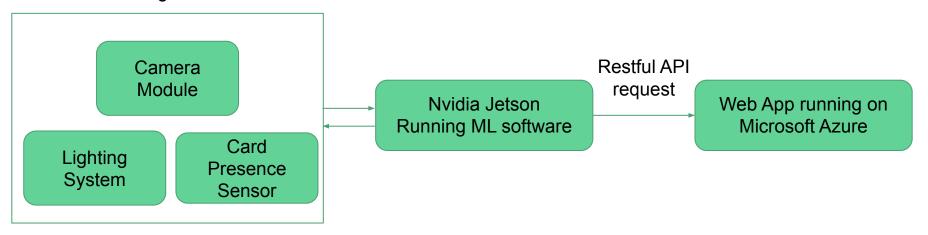

Our Design

System Flow Diagram

PCB Daughter Board

Requirements

- No user input
- Camera images playing card retrieved over a 0.5 second period
- Web app updates game state within 2 seconds of dealing card
- System can classify 52 cards (1 deck) retrieved over 26 seconds in even intervals within 104 seconds
- Card classification accuracy at least 94%
- Power system lasts 1 hour, imaging 312 cards (six decks of cards)
- No false imaging triggers

Technical Challenges

Image Processing

- Lighting, camera geometry, and camera optics
- Lens distortion correction
- Image segmentation
- Identify images to use for classification
- Machine Learning and Software
 - Tuning model and hyperparameters for accuracy and throughput requirements
- Hardware
 - Build/configure fabricate boards, spec controllers/SBC's, and hardware trigger
 - Drivers
 - Unobtrusive camera/reader

Solution Approach - Camera System & Image Processing

- Lens distortion correction offline in MATLAB
- Controlled lighting to compensate for uncontrolled environment and high framerate
- Segmentation and edge detection to identify suit and rank, improving classification accuracy

Solution Approach - Software

- OpenCV, Tensorflow, and/or PyTorch for image processing on Jetson Nano
- Host web app on Azure and interact with web app through RESTful API requests

Solution Approach - Hardware

- SBC and camera module eval board inside card "shoe" as an early prototype
- PCB Daughter Board containing all external sensors and hardware (camera, lighting, presence detector, etc.)
- Use findings from evaluation hardware to influence PCB design
- Time budgeted for two revisions of PCB

Testing, Verification, and Metrics

- Image Processing
 - Manually inspect image quality from camera
- ML/Software
 - Confusion matrix will give classifier accuracies
- Hardware
 - Test latency between card trigger and classification
 - Ensure SBC has enough memory to classify an entire card deck in 104 seconds

Tasks and Division of Labor

- Jeremy
 - Configure optical and electrical requirements for camera
 - Building imaging system
 - Image preprocessing
- Sid
 - Utilize OpenCV, PyTorch, and/or Tensorflow to train multiple ML models
 - \circ Develop web app for visual display
- Ethan
 - Write drivers
 - Design and order PCB's
 - Configure SBC's
 - Build hardware trigger

Schedule

			2/22 - 2/2	6		- 3/5		3/8 - 3/3	12	3/:	15-3/19		3/22 -	3/26		3/29 - 4/	2		4/5-4/9					4/19			4/26-4/30		5/3	- 5/7

Jeremy																														
	Determine camera geometric/optical/electrical requirements																													
	Determine lighting requirements									-																				
	Finalize and purchase camera evaluation board and LED options				Thur					-				-					1			-	-						+ +	-
	Test camera geometry, resolution, and blurring while moving playing cards	-													-						-		-			-			1	+
	Research and implement lens distortion correction	-		-								-	+									-	-						+++	-
	Prototype lighting setup. Determine if multi-illuminant lighting is neccessary	-													1	-					-	-				-				
	Create card segmentation			-		-															-		-			-				-
	Implement corner & edge detectors to crop card's rank and suit			-		-																-	-							-
		-		-		-				-											-		-					-	+ +	
	Build and test camera and lighting system beneath card shoe with custom hardware	-		-						-		-										-						-		
	Test camera geometry and lighting changes based on preliminary ML results	-		-		-	-	-		-		-			-	-	-											-	4	
	Verity final housing produces images of similar quality and lighting	-					-		_	-			1			-											_			
	Slack time		_																										4	
Sid																														
	Develop basic web app components					-	_		_				1				_						-							-
	Host web app on cloud						_																							
	Collect and preprocess training/validation/testing dataset		_																									_		
	Train SVM, fully-connected networks		-				_																							
	Research OpenCV, tensorflow, PyTorch, and other ML algorithms for low latency and suffici	ent accura	scy			_	_															-								
	Train convolutional neural network (if necessary)			_																			_							
	internal testing of web app's responsiveness to RESTful API requests			_																										
	Research image classification algorithms																													
	Train with second dataset																													
	Connect ML software on jetson nano with web app			8		8				3																			4 3	
	Integration		-				_									_		_					_						4	
Ethan		-																				-								
	SBC Selection + Board Ship Time Camera Module Selection	-		Eval Boa	ind Ship Tin	ne.									-		-	_			-	-					-		+++	
	Lighting/Card Detection System				Eval	Board St	up Time								-							-							4 9	
	Power System Design	-		-						-			1-1-							+++			-							-
	Order Parts/Housing	-	-	-				Parts She	point			-	12 11						2		12 12		-		-			-		
	Build Test Bed			3.1		1				1											8 8		1		1 8					
	PCB Design + Fab Time							1st Revis	ion		Fabrica	bon Time			2nd R	ev.	abricate	on Time												
	Work on Camera Drivers																													
	Integration/Assembly					1																								
	Slack Time			1																1										
Team		1.1.1					-												-				-	1		-				
	Prepare design presentation	-				-									-		-			-	-								4	
	Prepare design review report			-										-		-					-	-								
	Prepare final presentation Prepare final video	-		- 2 -		-												2	8	-	10				2 2					
	Prepare final video Prepare final report	-		-		-									1	-					-	-			-					
		-		-		-						-			-		-		-	-	1		-
