Problem: Fire and smoke alarms may tell occupants that they need to leave the building, but will not direct them away from the fires toward an exit.

Fire Escape

Team B8

Use Case

- Existing solutions
 - Maps posted on the back of doors
 - Typically based on finding closest exit, despite potential hazards
- Our take
 - Distributed node system will output an optimal path based on smoke and temperature readings at different locations
 - Occupants guided step by step out of building
- ECE Areas
 - Software, Hardware/Circuits

Use-Case Requirements (Hardware)

Requirement	Reasoning
100 second delay between node detection and occupant notification	NFPA requirement based on sprinkler system
Must run for 24 hours during power outage	The Pennsylvania Code General Fire Alarm Requirements
Operate in fire mode for 5 minutes after 24 hours of no hardwired power and completely recharge battery once the power returns	The Pennsylvania Code General Fire Alarm Requirements
Fire must be detected 95% of the time	Current spec of smoke detectors, from National Fire Prevention Association

Use-Case Requirements (Software)

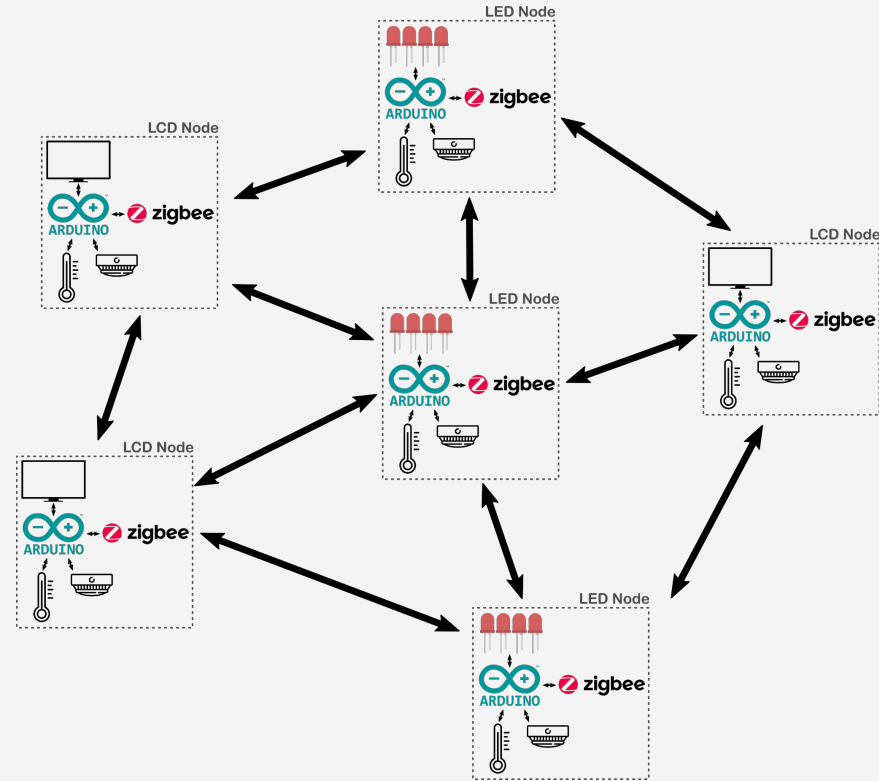

Requirement	Reasoning
Planned paths are optimal and correct 100% of the time	Sending users toward a fire would mean project failure
Path planning will run and display on nodes in under 10 second for a system of 10 or less nodes	Time it takes to leave a room and therefore find a node
Distributed computation to allow scaling	System can be adapted to larger buildings
Recharge battery once power comes back on	Batteries must be recharged so that they will be ready for another fire

Technical Challenges

- Hardware
 - Display how to get to the next node that occurs along the optimal path out of the building
 - Switching to battery power after a power outage, and recharging the battery when the power returns
 - Figuring out how to display floor plan and generated path on display
- Path Planning
 - Obtaining floor plans of distinct buildings with measurements of hallways, stairwells, etc.
 - Identifying which paths accessible from each node
 - Maintaining up to date data between all nodes on the network

Solution Approach

- PCB Fabrication for node structure
 - Node consists of LED/LCD, temperature/smoke sensors, XBee shield, arduino
- Distributed node system
 - LED Node
 - Only 2 or 3 possible directions
 - LCD Node
 - More in depth guidance on where to go next

Solution Approach (cont.)

- Communication
 - Custom ZigBee 2.4GHz network for node mesh
 - Nodes spaced less than 30 meters away for best reliability on ZigBee network using XBee hat (based on spec)
- Path Planning
 - Distributed Path-Planning across all nodes
 - Dijkstra-Scholten Algorithm
 - Compute the shortest path from all nodes to each exit
 - Will remove offline nodes from graph

Testing, Verification, and Metrics

Functionality	Testing Strategy	Metrics
Ability to detect fire	Place lit candles underneath sensors and watch for LED to light up	Fire should be detected 95% of the time
Path Finding	Calculate a path for a set of nodes and ensure that it is the shortest, and does not pass through “fire nodes”	A path should be found within 10 seconds for an average sized office building (19,000 sqft, from US Energy Information Association .

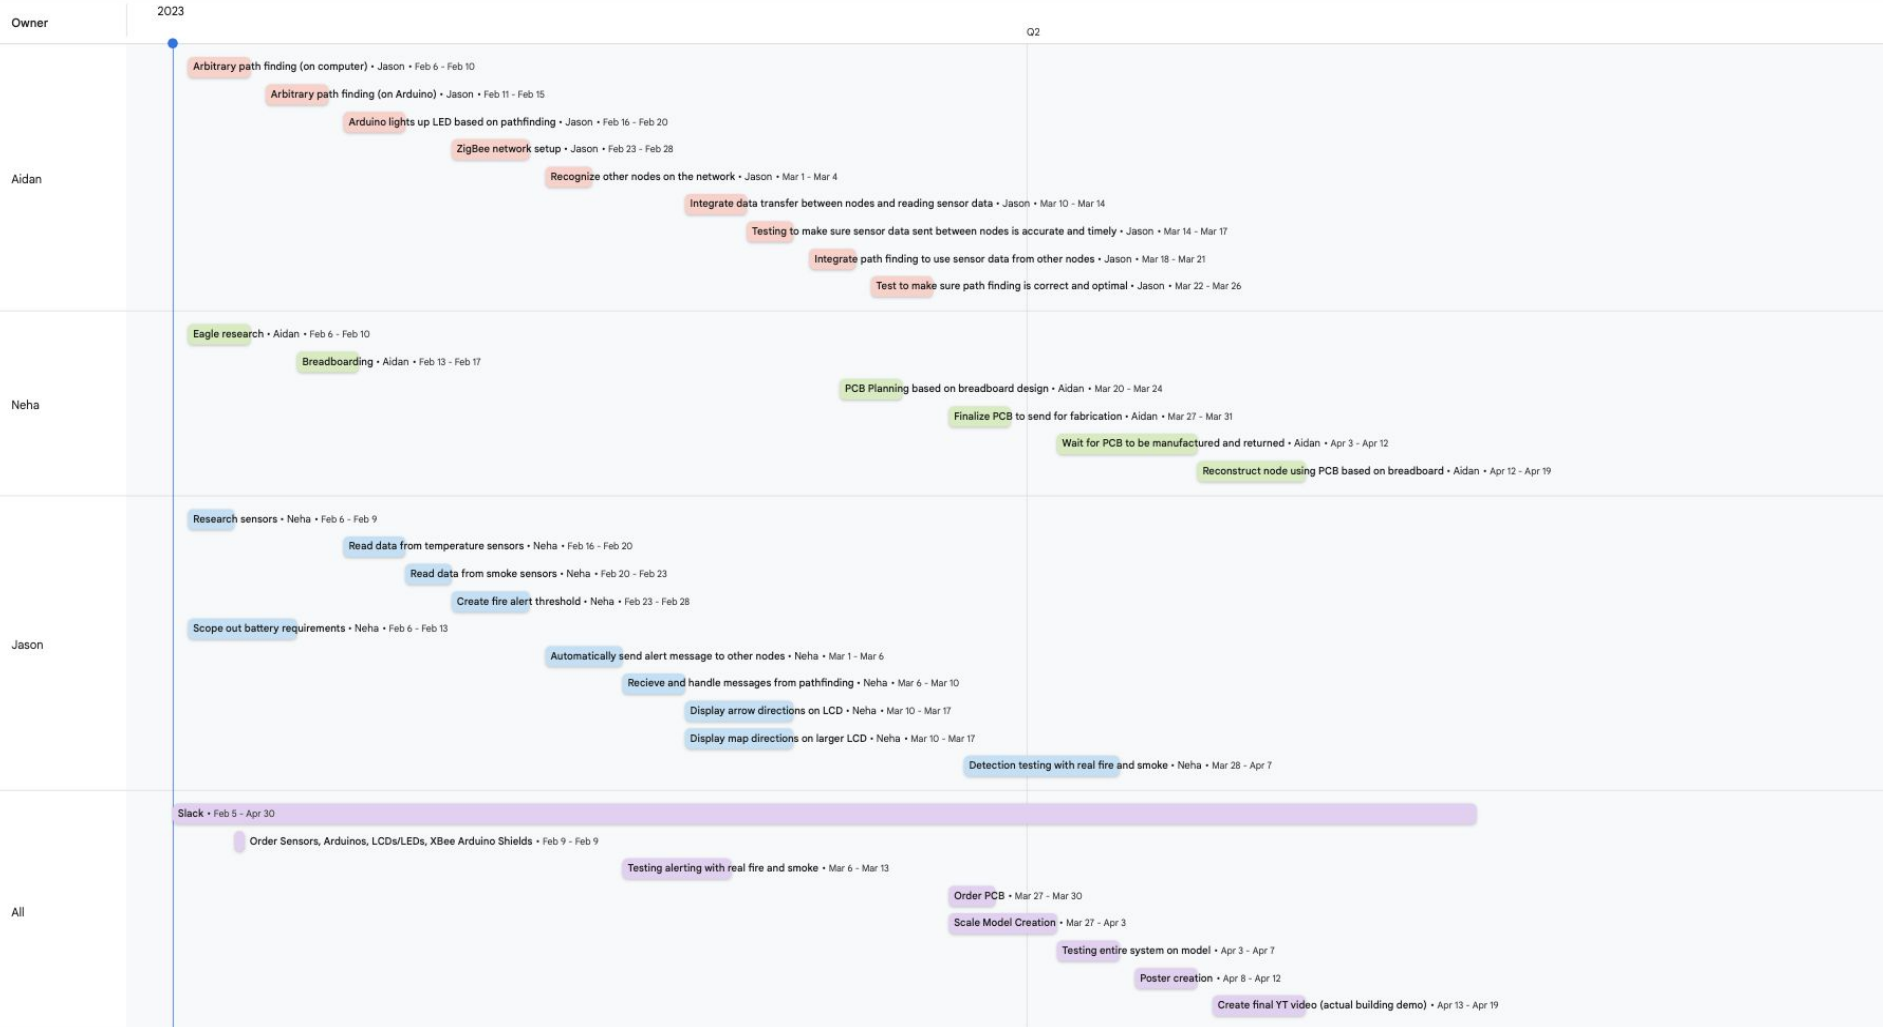

Testing, Verification, and Metrics (cont.)

Functionality	Testing Strategy	Metrics
Communication between nodes	Set up a heartbeat message that is sent between the arduinos and watch serial monitor to ensure messages are sent and received	Messages that are sent are received within 2 seconds to allow us to meet 10 second pathfinding
Display directions on nodes	Send direction instructions to nodes and ensure display looks correct	Should be able to be displayed for 5 minutes after 24 hours of idle.

Tasks and Division of Labor

- PCB Design
 - Aidan + Neha
- Node hardware
 - Neha + Jason
- Path Planning / Communication
 - Jason + Aidan
- Demo
 - All

*Specific task break down shown in Gantt Chart

Conclusion

- MVP
 - Optimal path generation based on inputted floor plan and fire detection from distributed node system
 - Display easy to follow path to direct occupant out of building
- Value
 - Streamline fire safety protocol to avoid chaos during tense times
 - Insight into systems that not only detect hazards, but identify solutions as well
