

### **Use Case**

Problem - Most games do not promote social connection nor active movement of the body

Solution - Game of pictionary with drawings visible in virtual space

- Provides a novel way of entertainment, as well as social interaction, bonding, and strengthening
- Fun way to form connections, (e.g. icebreaker games or company social events)
- Improves creativity, spacial awareness, and hand-eye coordination in children while still promoting social interaction

#### **ECE Areas**

- Software ECE area: line drawing algorithm and AR
- Hardware ECE area: pen used to track positional data

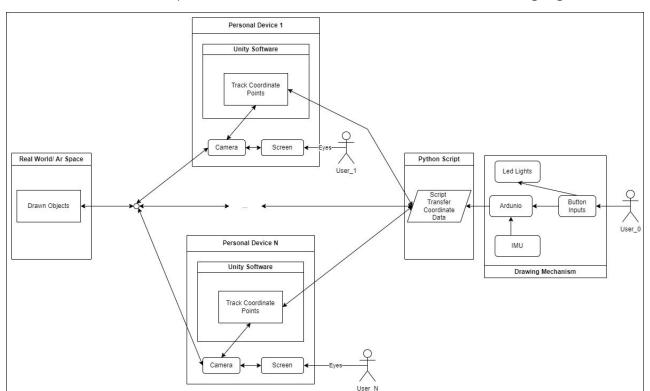

### **Quantitative Use Case Requirements**

- Encourage Social Interaction
  - 3 Players participate minimum
  - "Real time" (<1 second delay) gameplay where devices will interact
- Hardware is responsive and portable
  - Total latency of < 150 ms</li>
  - Less than 1lb and battery life at least 4 hours
- Drawn lines are relatively straight
  - Line pixel deviation < ½ inch both vertically and horizontally

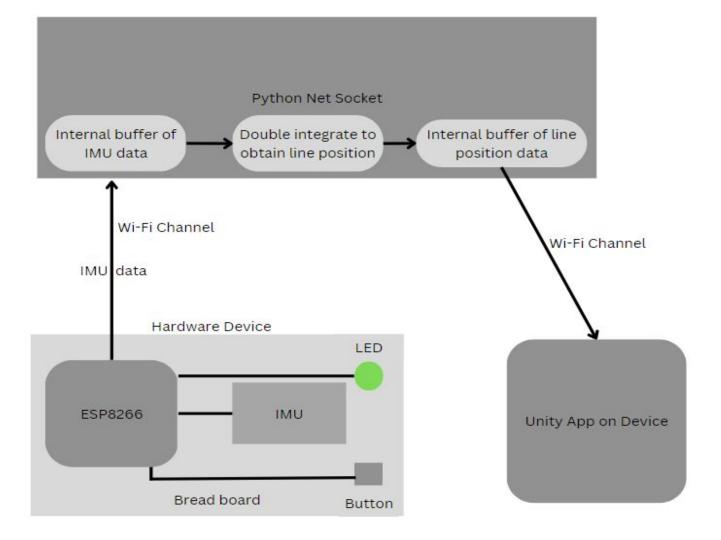

### **Solution Approach**

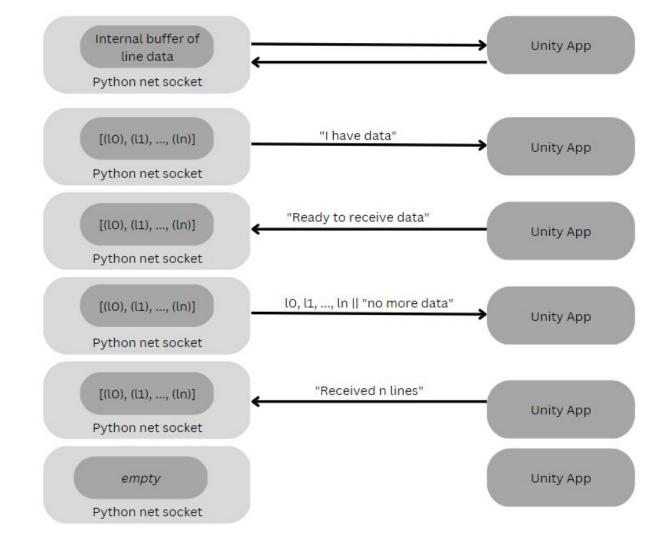

Will be using Unity for game development and for packages it offers Hardware Pen Component will be used to communicate for image generation

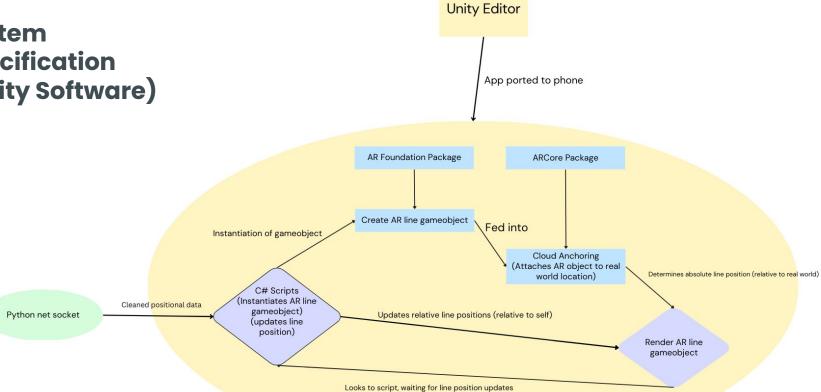

## System Specification (Hardware)

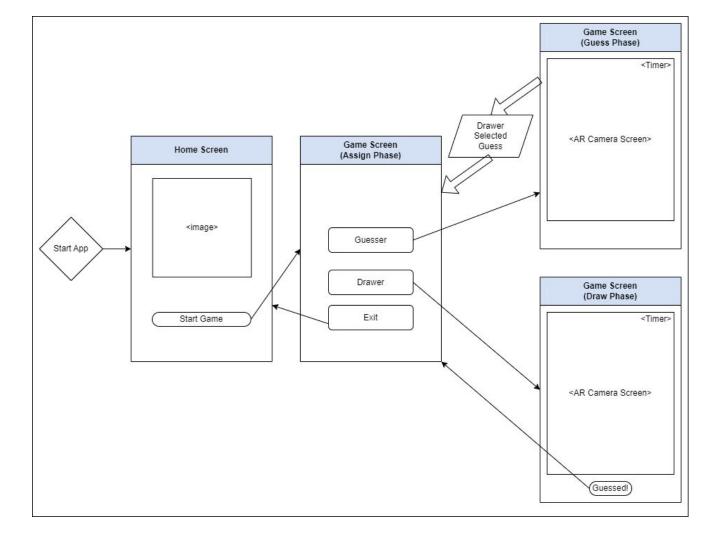

### Wifi Communication Protocol

# System Specification (Unity Software)

# System Specification (Game Scenes)

### Implementation Plan

### Buying:

- Hardware components
  - o ESP8266, LED, button, IMU

### Designing and Assembling:

• Pen is pieced together from bought hardware components

### Developing:

- Python script to function as net socket for data transfer
  - Receive data from IMU
  - Send data to Unity App
- Python script calculate line position from IMU data
  - Double integrate data
  - Estimation via trapezoidal integration

### Implementation Plan (cont)

#### Downloading:

- Unity
  - Implements game scene and renders line gameobject + C# Script communicates with Python Script
- ARFoundation
  - Allows creation of AR game objects and portability of app to android phone
- ARCore
  - Allows Cloud Anchoring functionality to position line gameobject in real world location

### Creating:

- Gamescene + AR objects (rendered virtual line)
  - o Real world replicated through use of camera
- Android application ported to phone

### Testing, Verification, and Metrics

- Pen
  - Collection of data during specified intervals
  - Measurement on latency of sending data
- Visual verification of drawn lines
  - User testing 4 out of 5 users are satisfied with the generated drawing
  - Achieve 90% accuracy between AR line and real line in overlapping line test
    - E.g. a virtual red line drawn over a real black line, 90% of line pixels should be red
- Game Functionality
  - 3 players are able to view drawing on devices
