

## Project 1 Part II: Metaproduct Primes

### ▼ What you know

- ▶ Basic BDD data structure and JAVA implementation
- ▶ A little bit about these things called “metaproducts”

### ▼ What you don't know

- ▶ All the tricks with metaproducts
- ▶ Using these to do Prime Implicants

© R. Rutenbar 2001, CMU 18-760, Fall 2001 1

## About Metaproducts

### Notation was created to support applications where we need to preserve the structure of things like SOP expressions

- ▶ ...ie, if you really **WANT** to write  $x + x'$
- ▶ ...and you want to represent and manipulate it as a **BDD**, what to do?

### Metaproduct notation

- ▶ Replace each variable "x" with a pair (rx, sx)
- ▶ If you see  $x$  in a product, then you get (rx)(sx) in metaproduct
- ▶ If you see  $x'$  in a product, then you get (rx)(sx')
- ▶ If you don't see any  $x$  or  $x'$  at all, then you get (rx')

### In English

- ▶ rx is the occurrence variable -> rx==1 says "x is here", rx==0 says "no x"
- ▶ sx is the sign variable -> sx==1 says "x is positive", sx==0 "negative"

© R. Rutenbar 2001, CMU 18-760, Fall 2001 3

## Metaproduct Example

### Suppose $F(x,y) = x + xy'$

- ▶ This is really just  $x$ , of course
- ▶ Its BDD would be simply

### As a metaproduct

- ▶ Assume var ordering was  $x < y$
- ▶ Then new ordering is  $x < rx < sx < y < ry < sy$
- ▶  $x$  becomes (rx)(sx)(ry')
- ▶  $xy'$  becomes (rx)(sx)(ry)(sy')

© R. Rutenbar 2001, CMU 18-760, Fall 2001 4

## Metaproduct Example

▼ You interpret this by looking at “satisfying paths” to “1” node

► There are 2 paths from root to “1”, each makes a product term

► Put the final products together for final answer:  $x + x'y$

© R. Rutenbar 2001, CMU 18-760, Fall 2001 5

## Metaproduct Example

▼ What happens if a variable is not present?

- We already saw this, but its worth noting
- In  $F(x,y) = x + xy'$ , consider “x” term
- There’s no “y” in there, but we still have to deal with “y”
- Rule is: if there’s no variable in there, you still have to include the occurrence variables for the missing original vars, but you include them in the negative polarity to note their absence

▼ So, term “x” becomes  $(rx)(sx)(ry')$

Means “no y vars in here”

▼ If this was  $F(x,y,z,w) = x$ , what would happen?

► We’d get  $(rx)(sx)(ry')(rz')(rw')$

© R. Rutenbar 2001, CMU 18-760, Fall 2001 6

## Metaproduct Primes

- Turns out you can represent Prime Implicants with metaproduct notation

These are all Primes – biggest product terms you can circle in a Kmap for your function

These are NOT all Primes – not all biggest product terms you can Circle in this Kmap

© R. Rutenbar 2001, CMU 18-760, Fall 2001 7

## Metaproduct Primes

- Like with Boolean functions, problem is SIZE
  - A function can have many many primes – way too many enumerate one by one
  - This is why representing them with something like a BDD is attractive, since its good at “compressing” Boolean functions
  - But this is also why we need a special notation, since we DON'T want the BDD to CHANGE our function to its canonical form
  - We need to represent it in some SOP form
- Big question: how do we find Primes using metaproducts
  - Of course, it's gotta be something recursive, right...?

© R. Rutenbar 2001, CMU 18-760, Fall 2001 8

# Metaproduct Primes

## There's another Shannon-style recursive decomposition

- ▶ You start with a BDD in your original variables
- ▶ You end up with a BDD in the (occurrence, sign) metaproduct variables
- ▶ Final BDD represents, as SOP form, ALL the primes

## Basic decomposition

- ▶ Let  $P(\text{BDD root of } F)$  = metaproduct BDD for all PRIMES in function  $F$

© R. Rutenbar 2001, CMU 18-760, Fall 2001 9

# Metaproduct Primes

## ...why does that work?

- ▶ Roughly speaking –this is just the messy check for how to “reassemble” primes when they get split up during a Shannon decomposition

$$\begin{aligned} f(x,y,z) &= x'y + yz' = 2 \text{ primes} \\ &= y f_y + y' f_y \\ &= y(x'+z') + y'(0) \end{aligned}$$

$$\begin{aligned} f(x,y,z) &= x = 1 \text{ prime} \\ &= y f_y + y' f_y \\ &= y(x) + y'(x) \end{aligned}$$

When we factored on  $y$ , we “chopped up” the prime like this

When we factored on  $y$ , we “chopped up” the prime like this

© R. Rutenbar 2001, CMU 18-760, Fall 2001 10

# Metaproduct Primes

## ▼ “Reading” the decomposition

© R. Rutenbar 2001, CMU 18-760, Fall 2001 11

# Metaproduct Primes

## ▼ Let's be a little more careful on the details of BDDs and ops

- ▶ Assumes you have AND and NOT (ie, "!") on BDDs
- ▶ Assumes  $P(\cdot)$  calculated just like ITE, as a top-down recursion
- ▶ Assume var order is fixed: for vars  $x, y, \dots$ , its:  $x < rx < sx < y < ry < sy$  ....

© R. Rutenbar 2001, CMU 18-760, Fall 2001 12

# Metaproduct Primes: Termination

▼ So we know the recursion is:

▼ ...next question: what are the termination conditions for  $P()$ ?

- ▶ So, when can we quit, and return a known BDD node answer?
- ▶ Easy case:  $P(0) = 0$
- ▶ Harder case:  $P(1) = \text{a little messy...}$

© R. Rutenbar 2001, CMU 18-760, Fall 2001 13

# Metaproduct Primes: Termination

▼ Suppose vars are:  $x, y, z, w$ , and we have this recursion

▼ Intuition

- ▶  $P(0)$  means "you're done – nothing more at all this prime term"
- ▶  $P(1)$  means "you're done – but remember that these vars are **absent**"

© R. Rutenbar 2001, CMU 18-760, Fall 2001 14

# Primes Example

$f(x,y,z) = x' + y'z = 2 \text{ primes}$

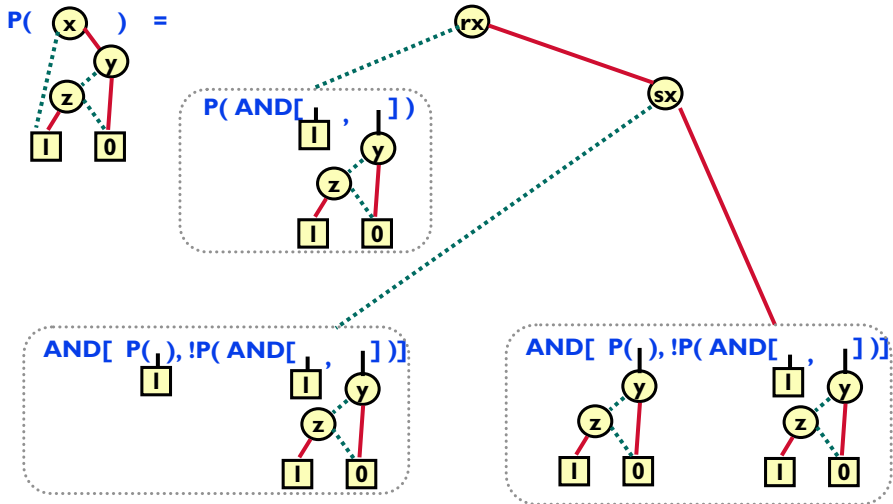

Ordinary BDD with var order:  $x < y < z$

Apply recursion at root of f()

# Primes Example

Applying recursion at root of f()

## Primes Example

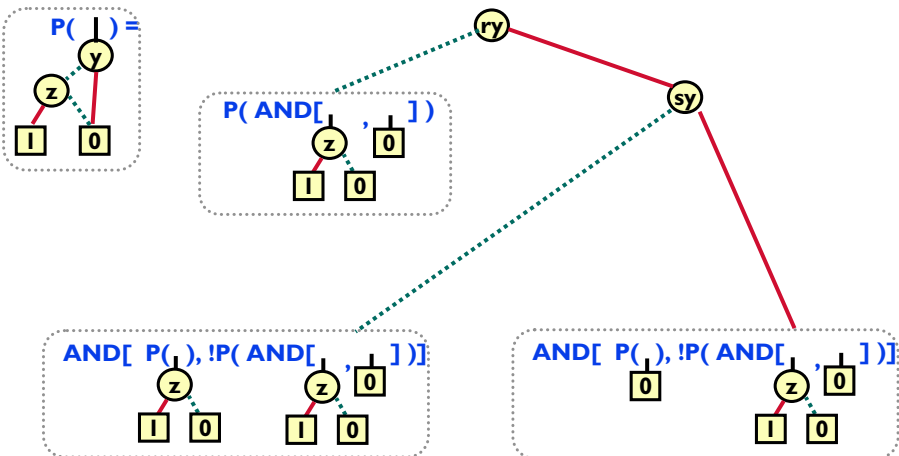

Do the obvious simplifications now (just to simplify for this manual example)

© R. Rutenbar 2001, CMU 18-760, Fall 2001 17

## Prime Example

▼ OK, we need to do this one next

© R. Rutenbar 2001, CMU 18-760, Fall 2001 18

## Prime Example

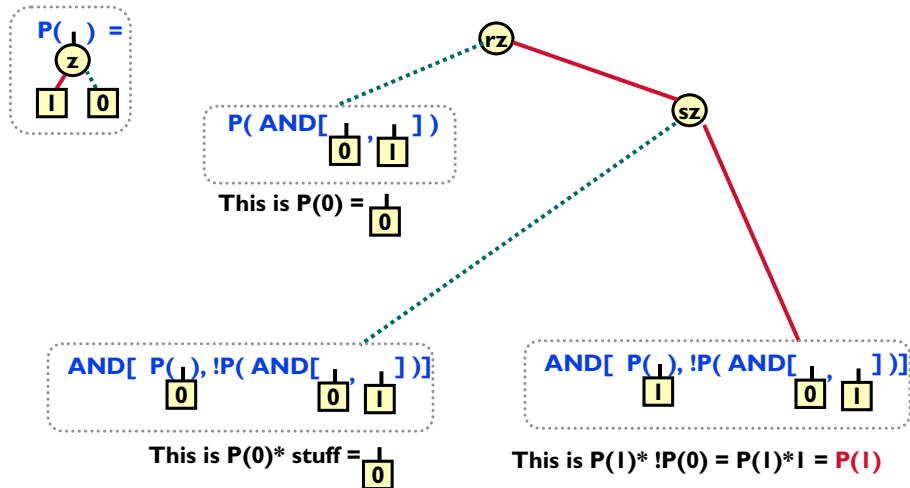

▼ Again, do obvious simplifications (just for this manual ex)

© R. Rutenbar 2001, CMU 18-760, Fall 2001 19

## Prime Example

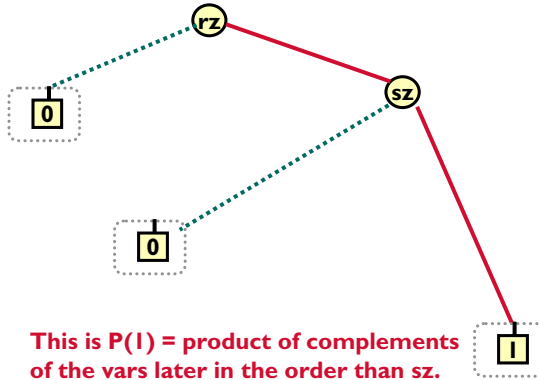

▼ We have to do this one next – and its easy...

© R. Rutenbar 2001, CMU 18-760, Fall 2001 20

## Prime Example

▼ We have to do this one next – and its easy...

This is  $P(1)$  = product of complements of the vars later in the order than  $sz$ . Since  $sz$  is the LAST var in the order, the rule is: this is just “1”

© R. Rutenbar 2001, CMU 18-760, Fall 2001 21

## Prime Example

▼ Return results up recursive call tree...

Note – I’m leaving in all the separate “0” and “1” nodes just to **simplify** the drawing – it’s a REAL BDD, there’s only a single “1” and a single “0”...

© R. Rutenbar 2001, CMU 18-760, Fall 2001 22

## Prime Example

Return results up recursive call tree...

© R. Rutenbar 2001, CMU 18-760, Fall 2001 23

## Prime Example

This one is next to recurse on

Since we know  $P(1) = \text{product of complements of vars below } sx \text{ in the order, this is supposed to be: } (ry')(rz')$ , so we get...

...which is just ordinary BDD ops

© R. Rutenbar 2001, CMU 18-760, Fall 2001 24

# Prime Example

▼ BDD ops give this

© R. Rutenbar 2001, CMU 18-760, Fall 2001 25

# Prime Example

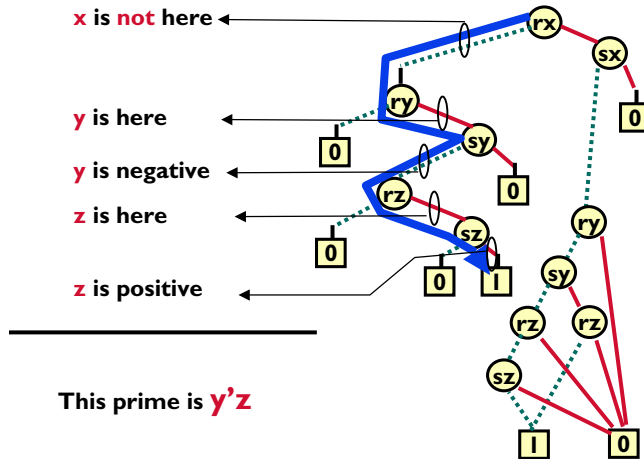

▼ Return results up recursive call tree...

© R. Rutenbar 2001, CMU 18-760, Fall 2001 26

## ..and, that's the Final Metaproduct for Prime( )

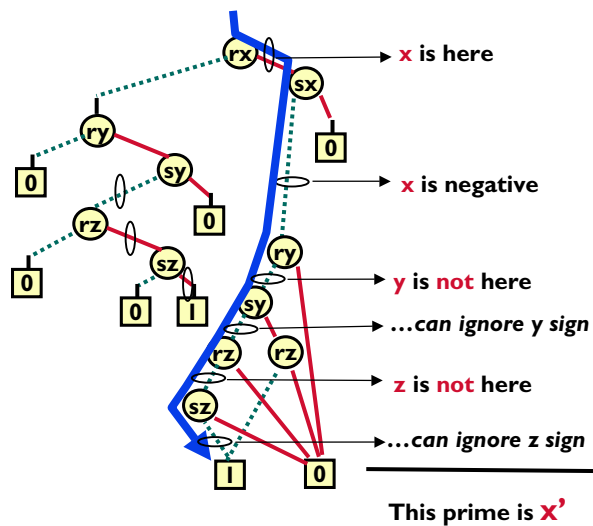

▼ Look for paths from root to "1"

© R. Rutenbar 2001, CMU 18-760, Fall 2001 27

## Final Primes

▼ More paths

© R. Rutenbar 2001, CMU 18-760, Fall 2001 28

# Final Primes

▼ ...hey, there's another one...?

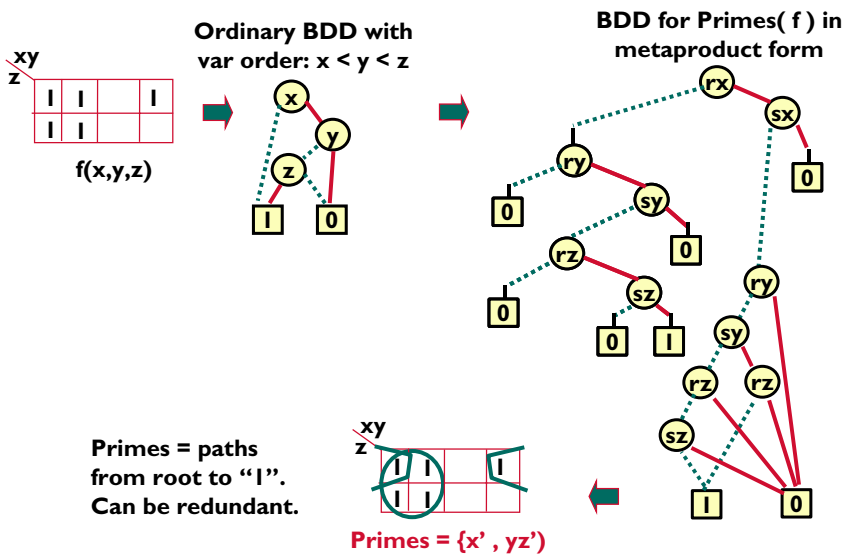

An unfortunate fact about metaproducts: they can be redundant about primes. You don't get the wrong ones – but you can get right ones **several** times.

© R. Rutenbar 2001, CMU 18-760, Fall 2001 29

# Metaproduct Primes

▼ So what did we do?

© R. Rutenbar 2001, CMU 18-760, Fall 2001 30

## ...back to 18-760 Project 1 Part 2

### ▼ What do we want?

- ▶ We want you to add **P( BDD for function f )** as an operator to your **JAVA BDD** package
- ▶ Do it exactly like we showed here
  - ▷ Just like **ITE**: you descend the starting **BDD** for **f**, and you recursively “trace out” the **BDD** for **P(f)**
  - ▷ Assume you have all the vars defined in the right initial order. This means if the real vars are **x, y**, **YOU** have **x, rx, sx, y, ry, sy** in order
- ▶ You have 2 basic goals
  - ▷ To be able to transform a **BDD** for function **f** into **Prime(f)**
  - ▷ To print out some interesting “info” about these primes

© R. Rutenbar 2001, CMU 18-760, Fall 2001 31

## Prime( ) Details

### ▼ Things to be careful about

- ▶ Before doing anything, you probably want to build the function: **(rx')(ry')(rz')...(rlast')** for **ALL** your vars. And make an array of pointers to the nodes, so that when you need **P(l) = product of complemented occurrence nodes below me** – you can just look it up
- ▶ You still need to call **FindOrCreateNode()** (on the 2 new nodes you make. You want to build **sx** and its children first, call **FindOrCreatNode(sx)**, then finish the recursion on **rx**, then call **FindOrCreatNode(sx)**).
- ▶ Do you want to do something like a different **OPS** table for the **Prime** computation? (It's not required...but think about it)
- ▶ You will want to write a “**printprime**” routine that walks the paths to the “**l**” node, and prints out sensible product terms. **DO NOT** worry about the redundancy issue – not your problem.
- ▶ You also want to build a “**numprimes**” routine that just prints out the number of paths to the “**l**” node. Think about it – you don't have to walk them all to do this, it's a very simple recursion if you know **numprimes(hichild)** and **numprimes(lochild)**, and **numprimes(l)=l** and **numprimes(0)=0**

© R. Rutenbar 2001, CMU 18-760, Fall 2001 32

## Metaproduct Primes: Summary

### ▼ Interesting, sort of funky BDD application

- ▶ Twists the usual interpretation of “canonical BDD form” around a lot
- ▶ Works fine, a bit arcane
  - ▷ (This is a simplification of how people really do it. There are a bunch of other optimizations to get rid of those redundancies that make it a lot faster. Not worth the grief to go thru them all...they violate a lot of BDD rules.)

### ▼ For Project 1

- ▶ Implement Prime( f )
- ▶ Look on the `/afs/ece/class/ee760/proj1` directory for more details, and for some info about benchmarks to run
- ▶ Ask TA and Prof questions if there are any issues at all on this one
