Project Website: Technical Specifications

◆ All of the components used to build your prototype
◆ Think of this section as the "technical specs" section of your product, if someone were to purchase it
  ► Have three subsections – hardware, software, protocols

◆ List all your hardware components
  ► For each component, provide technical specifications (vendor, processor speed, memory, storage, etc.) – does not hurt to be detailed
  ► For each component, provide a link to the vendor that we will purchase this from (if that is the case)
  ► For each component, provide an estimated cost, if you have the number
◆ List all your software components
  ► For each component, provide technical specifications (vendor, programming language, compliance to standards) – does not hurt to be detailed
  ► For each component, provide a link to where the software can be downloaded
◆ List all protocols used
